NEW AKVIS Artifact Remover AI 1.0: Remove JPEG Artifacts and Pixelization!

August 9, 2021 — AKVIS launches a new free program - AKVIS Artifact Remover AI 1.0, the AI-powered image enhancement software. The program repairs images with any compression ratio; eliminates JPEG artifacts, reduces noise and pixelization.

Artifacts are the unwanted side-effects of image processing. JPEG artifacts are typically caused by aggressive image compression and appear as loss of sharpness, extra dots, seams, blurry blocks, jagged or misfitting edges, smudged details, distortions, and color degradation. Such defects may ruin an important and valuable photo.

The new AKVIS program is equally effective to get rid of all types of artifacts, including so-called mosquito noise, pixelation, etc.

AKVIS Artifact Remover AI uses machine-learned algorithms to eliminate JPEG artifacts, noise, and defacements, reduce pixelization and clean up edges.

The software includes three image adjustment modes to choose from, depending on the quality of the processed photo: *Low Compression*, *High Compression*, and *High Compression with Noise*. Also, as additional post-processing, the program allows sharpening image edges. The software allows users to create high-quality images without artifacts.
